CAPSTONE PROJECT OVERVIEW

Project Delivery Assistant - Powered by AI

Official topic: 02 - Consulting or Project Delivery Assistant

Business problem

Project Managers manually read project plans and meeting discussions to track decisions, action items, dependencies and delivery risks. Information can be fragmented and follow-ups overlooked.

Solution objective

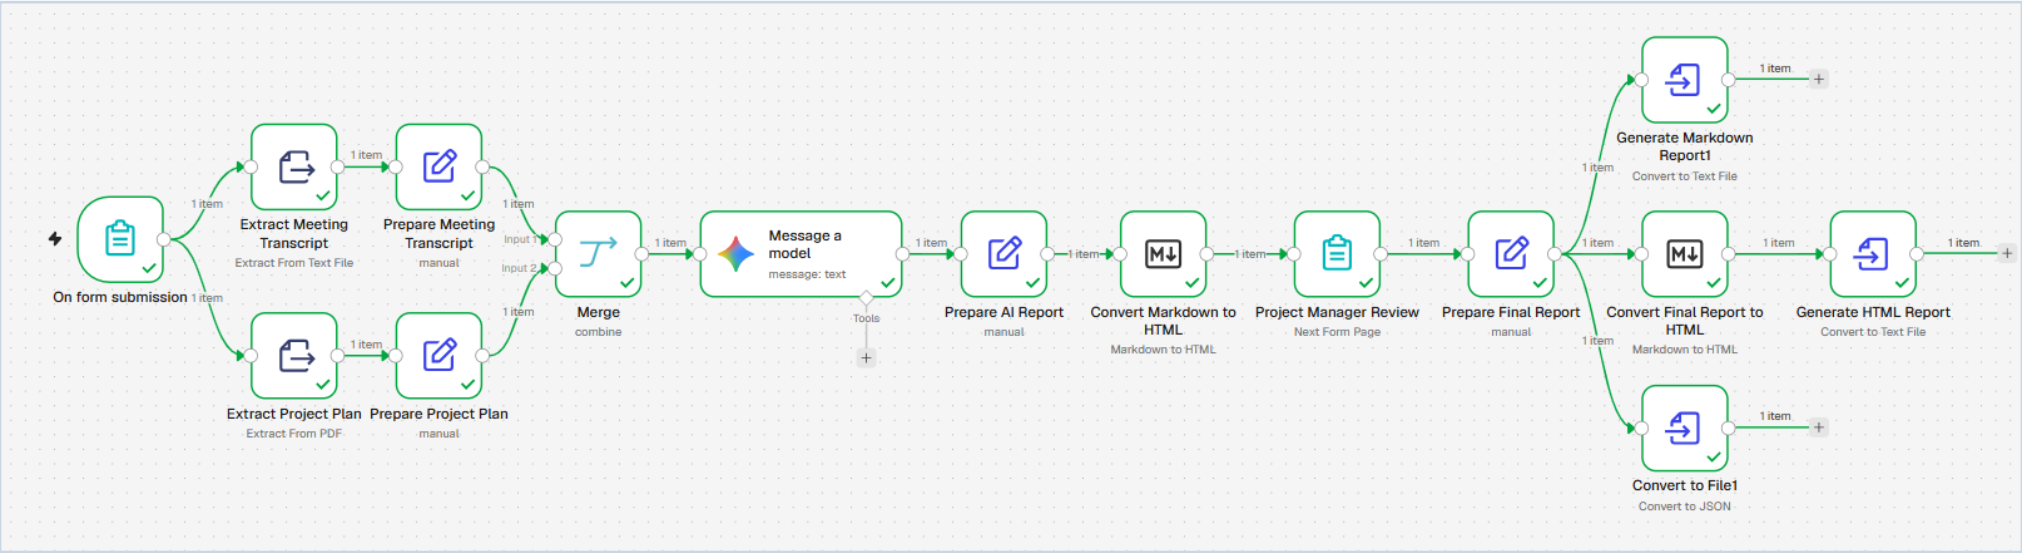

Use n8n and Google Gemini to compare a baseline plan with a meeting transcript, draft a structured delivery report, obtain a human review, and export the reviewed report.

Scope of the working demonstration

Inputs:	Fictional Enterprise Customer Portal project plan (PDF) and sprint meeting transcript (TXT).
AI analysis:	Meeting minutes, actions with owners/dates, delivery risks, blockers and plan-vs-meeting observations.
Human review:	Project Manager selects Approved or Needs Changes and records comments.
Outputs:	Reviewed Markdown, HTML and JSON files; Needs Changes is labeled as draft.

End-to-end n8n workflow

Latest tested workflow (screenshot supplied by learner)

Implementation stages

1. Upload & extract	Form receives PDF/TXT; Extract From File reads each.
2. Merge & analyze	Prepared text is merged and analyzed by Gemini.
3. Format for review	Markdown-to-HTML converts the draft for form display.
4. Manager review	Manager approves or requests changes with comments.
5. Export	Prepare Final Report; generate MD, HTML, JSON branches.

Demonstration, value and submission

Example scenario

Login API baseline due 23 Oct 2026. In the meeting it is reported as about 80% complete, with token validation outstanding. UI integration and QA are dependent on API readiness.

AI-generated output

Draft meeting summary, assigned actions, risk assessment and milestone observations. Project Manager reviews the proposed report before it is exported.

Business value

- **Time saved** Less manual consolidation of notes and project records.
- **Visibility** Clear owners, dates, blockers, dependencies and next actions.
- **Governance** Recorded approval decision and reviewer comments.

Submission evidence / reproducibility

Include the n8n workflow JSON export, synthetic input documents, Gemini prompt, generated Markdown/HTML/JSON reports, screenshots of successful execution and manager review, and a README explaining import, credentials, and testing. Upload all working files together as one ZIP.

Limitations: AI findings need verification; this demonstration uses fictional project data.
